

ROSA Team announce ROSA Desktop 2012 Release Candidate

The work on the new generation of ROSA Desktop operating system is coming to its end. Release candidate is the fourth and the last test version of the distribution. Since the alpha release in August, 2012 developers have significantly improved stability of the system, fixed all critical issues and added support for a wide range of modern hardware.

Among the changes implemented by company engineers especially for the release candidate of ROSA Desktop 2012, one should highlight significant updates in the semantic desktop tool (TimeFrame) and improvements in the GRUB2 boot loader. And GRUB2 modifications have been already accepted by upstream.

Experiments with design were continued, as well. They concerned both general graphics theme and standalone applications, as well as dozens of new icons. Thanks to the work done, the system obtained more modern appearance and was even favored with review from designers of Art. Lebedev Studio.

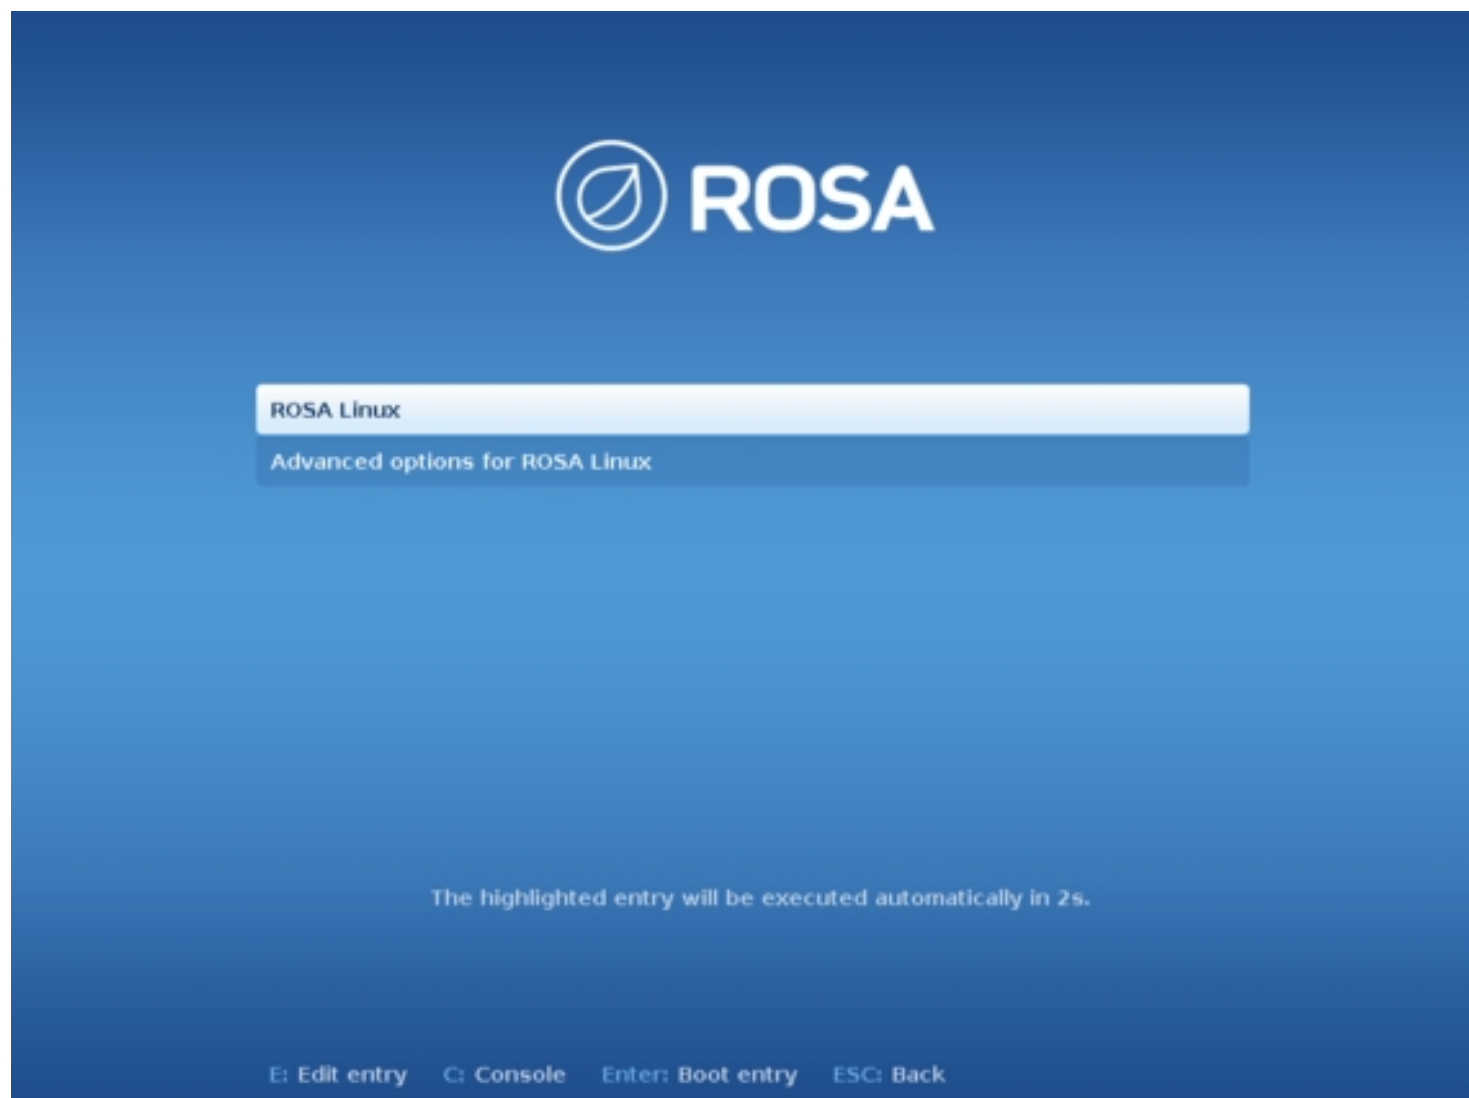

The Release candidate includes fresh versions of major system components and user software. It is the emphasis on fresh software versions that makes the major distinction between ROSA Desktop 2012 and other items from the company's product line. To highlight this fact, we are
