

MIB keeps supporting Mandriva Linux 2010.x serie

2010.3 is a major update for 2010.2. It includes at least:

- new Qt4
- new KDE4
- updated GTK stack, including basic GTK3 support
- new Alsa and PulseAudio
- new Mesa & DRM
- new X.Org Server
- new kernel 3.2.x
- updates for "major" applications like GIMP, Qt Creator etc.
- major codecs and players update (gstreamer, mplayer, vlc, ffmpeg etc), all with PLF feautres enabled

and more updates are coming.

In general, it should be compatible with 2010.2 repositories. And we try to make updates as easy as possible. There should be no problems with installing 2010.2 and updating it from MIB 2010.3 repository. And no problems with installing packages from 2010.2 updates & backports.

MIB Mandriva 2010.3 repositories

There are no installation ISOs yet. But we have plans to release them one day.

2010.3 is not really a fork. We don't plan to support it forever. And we don't have infrastructure and manpower for that. Our goal is to keep 2010.2 as much up to date as possible but without sacrificing its stability.
