

Hplip 3.11.1 > 3.11.3a for Mandriva Linux 2010.2

Hplip è l'insieme di driver e utility per il prodotti HP (stampanti, scanner, ecc.).
Porting che riprende quello presente in cooker per la 2011.
Questo aggiornamento è utile per chi come me ha acquistato una stampante recente che non era supportata dalla versione presente sulla 2010.2.

This is the HP driver package to supply Linux support for most Hewlett-Packard DeskJet, LaserJet, PSC, OfficeJet, and PhotoSmart printers and all-in-one peripherals (also known as Multi-Function Peripherals or MFPs), which can print, scan, copy, fax, and/or access flash memory cards.

It is work in progress, but printing, scanning, memory card access, ink/toner/battery/consumable level checking, and inkjet printer maintenance are supported on most models, when either connected to the USB or LAN (built-in interfaces or selected HP JetDirect models) on a Linux workstation with CUPS printing system.

For status and consumable checking and also for inkjet maintenance there is the graphical tool "hp-toolbox" available (Menu: "System"/"Monitoring"/"HP Printer Toolbox").
