

## MediaDownloader 1.5.1-3 for Mandriva Linux 2010.2

MediaDownloader is an opensource software that let you search, watch and download items with Google Image and YouTube.

### Features:

Search results are displayed as thumbnails within a nice mouse scrollable view. However the interface is fully real time customizable by editing a style file and, for items view, by a dialog allowing to choose a background image and a three color gradient.

MediaDownloader can make a slide show of searched videos and images, set images as wallpaper, save and restore searches, make multiple searches by a given text file, and also convert local videos or videos while downloading (for example you can extract audio as mp3 from videos or convert all for Ipod) by the means of a nice ffmpeg GUI frontend.

A "Firefox monitor" will look at the firefox cache to catch video streaming contents while browsing (only linux for now): it will monitor activities when you are browsing the web, and, if it catches some video streams, it will be added into the grid. It works with almost all streaming video with mime type "video/\*", you should see all format as supported by your system. Generally, for videos that aren't grabbed thumbnail images are showed, so you will see the mediadownloader icon instead, while for YouTube they are treated as usual.

added Google Suggestion hints for search box

added automatic search to add items while scrolling the view

added a button to open downloads directory

thumbnails color customizations

thumbnails redesigned

now downloads doesn't overwrite existing file

fixed displayed text in download window

fixed background of volume slider

fixed display video toolbar when back from fullscreen

### **A couple of notes from the author (Marco Bavagnoli: lil.deimos@gmail.com):**

\* Could happens that Google changes some search url parameters, for this reason there is an ajax search method, it most likely always works but it's slower because it searches only 3 results at once instead of the 21 of the public method.

\* Seeking while flv is playing restarts video (if someone have a solution please tell me).
