qBittorrent 1.5.5 per Mandriva 2009.1 e 2010.0

The qBittorrent project was created in March 2006 with the idea of developping a new Bittorrent client for Linux (and possibly other systems) that would be easy to use, good looking, featureful but lightweight.

qBittorrent is a Free Software released under the GNU GPL license.

The author is Christophe Dumez, a French student in an engineer school (UTBM), in IT departement.

qBittorrent is based on the great Libtorrent by Arvid Norberg.

qBittorrent features

qBittorrent can now be considered as a good alternative to other bittorrent clients. It provides a lot of features such as:

- A polished Graphical User Interface written with Qt4 toolkit
- UPnP / NAT-PMP port forwarding support
- Encryption support (compatible with Azureus)
- Multiple simultaneous downloads / uploads
- Download from RSS streams
- An integrated search engine
- DHT (trackerless) support
- uTorrent Peer eXchange support (PeX)

-

Directory scanning with automated download of torrents inside

-

Good internationalization (~25 languages supported)

-

Selective download of files in a torrent

-

Media File previewing while downloading

-

Torrent trackers edition and prioritizing

-

Seeders / Leechers displayed in download list

-

Styles support

-

Files prioritizing in a torrent

-

Torrent download in correct order

-

System tray integration

-

Tracker authentication support

-

Unicode support

-

Torrent downloading directly from their url

-

Connection though a proxy

-

IP Filtering similar to the one in eMule or PeerGuardian

-

Torrents queueing and prioritizing (**new!**)

-

Web user interface for remote control (**new!**)

-

Azureus spoofing to avoid ban (**new!**)

- Allow to buy your downloads thanks to Sharemonkey (**new!**)

Go ahead and try qBittorrent, you won’t regret it!
