

### Synaptiks 0.3.2 for Mandriva Linux 2010.0 & 2009.1

Synaptiks is a touchpad service for KDE 4.  
This service configures and manages your touchpad.

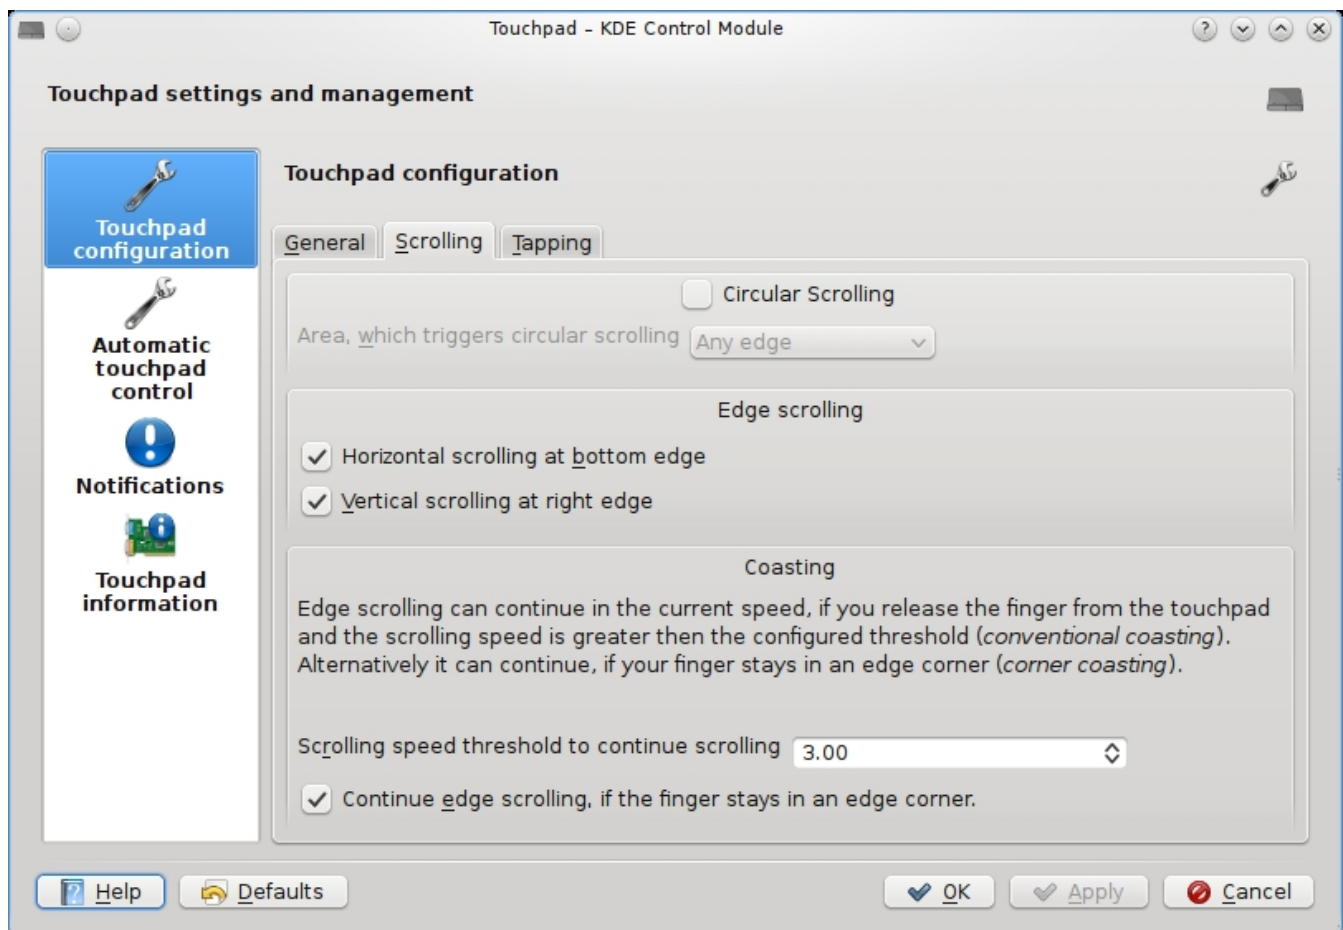

It can switch of your touchpad automatically, if you are typing on the keyboard, or if an external mouse is plugged. These features as well as basic settings of the touchpad driver can be configured in a convenient System Settings module.

A simple Plasma applet is also included. This applet gives visual feedback about the touchpad state and provides a quick way to open the touchpad configuration.

The [Synaptiks Handbook](#) describes usage and configuration of synaptiks. Read this to get an idea, how synaptiks works and what it can do for you.
