

### Guvview 1.4.4 for Mandriva Linux 2010.2

#### GTK+ UVC Viewer

This project aims at providing a simple GTK interface for capturing and viewing video from devices supported by the linux UVC driver, although it should also work with any v4l2 compatible device.

The project is based on [luvcview](#) for video rendering, but all controls are build using a GTK2 interface.

You can also use guvcview (since version 0.9.9) has a control window only, (from console: `guvcview --control_only`), this allows image control on other apps, like ekiga, cheese, mplayer, skype, ...

Guvview audio support is based on the [portaudio](#) library, up until version 0.9.3 the blocking API was used for audio capture, since version 0.9.4 the callback method is used instead, this provides better performance, it is also the preferred method for the portaudio API.

All interfaces (ALSA, OSD, JACK, ...) supported by portaudio should be available in guvcview. Just make sure portaudio was compiled with the desired interfaces enabled.
